SUMMARY

AI & Data Science undergraduate with production experience building scalable LLM applications, agentic AI systems, and intelligent automation pipelines. Passionate about developing reliable AI products that solve complex real-world problems.

EDUCATION

Karpagam Academy of Higher Education	— 2023–2027
B.Tech Artificial Intelligence & Data Science	CGPA – 8.56

WORK EXPERIENCE

AI Engineering Intern | Infynd — Feb 2026 – Present

- Built a two-stage company-people extraction pipeline processing **2.5M+ companies**, using **GLiNER** for initial extraction and **Gemma4-E4B (via vLLM)** for LLM-based extraction from raw scraped content, yielding **1.2M+** people records
- Built an agentic **AI system** using **LangGraph** to autonomously crawl company websites and extract structured company information as clean, standardized output
- Built data quality and **QA workflows** using SQL and Python to identify duplicates, missing records, and extraction inconsistencies across large-scale pipeline outputs
- Built a job title normalization system using **vector embeddings and a vector database** to map inconsistent, multilingual job titles to a standardized taxonomy, with LLM-based evaluation for edge cases

Technical Head (Student Chapter) | GeeksforGeeks — Jun 2025 - Jun 2026

- Conducted Python & Data Science workshops and led a 2-day intra-college hackathon, mentoring students on projects and career paths.

AI Intern | Stepping Edge — Jun 2024 – Dec 2024

- Developed **REST APIs** for web scraping and structured product data extraction from e-commerce platforms, enabling automated catalog generation
- Built backend services to manage chatbot conversation history and multi-turn session continuation using unique session IDs
- Enhanced LLM chatbot performance using **LangChain**, implementing few-shot prompting and improved query handling
- Researched and prototyped **RAG, Knowledge Graph** integration, and **image similarity** search for intelligent product discovery

PROJECTS:

DomainIntel [Python, LangGraph, Crawl4AI, Qwen2.5, Pydantic v2] — Code

- Designed a 9-node **LangGraph** pipeline to autonomously crawl, extract, and structure B2B company intelligence, including social URL extraction, redirect resolution, and a SaaS-style review dashboard

Satellite-Based Air Quality Downscaling [Python, Random Forest, CNN, Satellite Data (.nc)] — Code

- Developed ML models converting low-resolution satellite pollution data into high-resolution local air quality maps using Random Forest and CNNs, achieving >90% validation accuracy

TECHNOLOGIES

Python, FastAPI, SQL, MySQL, LangGraph, LangChain, vLLM, Ollama, GLiNER, spaCy, Crawl4AI, Asyncio, Docker, Git, Linux, TensorFlow/Keras, Scikit-learn, Pandas, Numpy

SKILLS

LLM Applications, Agentic AI, AI Automation, Information Extraction, Web Scraping, ETL Pipelines, Backend API Development, SQL Analysis

ACHIEVEMENTS

- Winner — InFynd AIM 2025 Hackathon (AI & B2B Data Intelligence Solutions)
- Finalist — Smart India Hackathon 2024 (ISRO Problem Statement)
- Finalist — Rakathon 2024 (Rakuten India)
